**Dr. David Rogowski**  
Wildlife Specialist Regional Supervisor  
Arizona Game and Fish Department

**Vahid Nikoonejad Fard**  
PhD Candidate and Capstone Mentor  
at Northern Arizona University

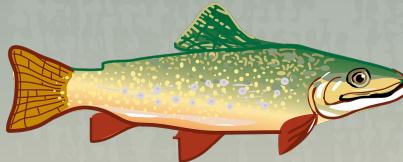

# Introduction

- AZGFD & GCMRC researching the major fish populations below the Glen Canyon Dam
- See the potential effects dams might be having on these populations
- Large volumes of data needs to be collected

# Problem Statement

- Researchers/scientists have had a hard time collecting large amounts of data
- To view a caught fishes previous information an angler must call a scientist with access to the database

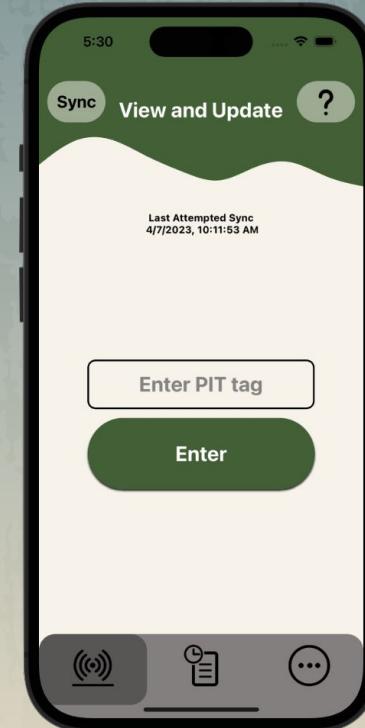

- Established dams are known to have negative impacts on fisheries

- Anglers from AZGFD only go collect fish data on the fishery 3-4 times a year

- To update a fish's information it must be verbally relayed to the same scientist

# Solution Overview

- Easy pairing via Bluetooth, with an option for manual entry as a back-up
- The app will be able to verify that a PIT Tag is correct and already in the system when it is entered
- Date and time will automatically be recorded, so anglers will only need to record mile marker and length
- The app will store the data until the phone is connected to the internet, where it will then upload all information to the server's main database
- Anglers will only need to worry about entering data on their fish in the moment, the app will handle relaying it to AZGFD

# Requirements / Specifications Review

**Product description:** A mobile-based fish identification tool for the Arizona Game & Fish research group.

## Key requirements:

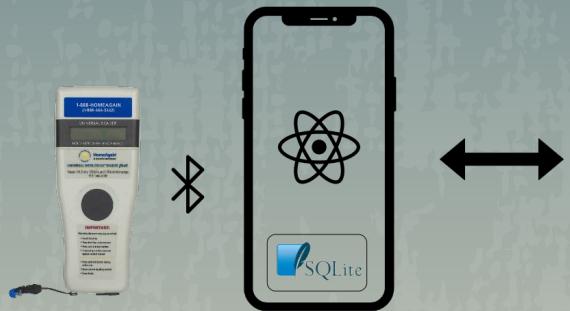

- Ability to retrieve a fishes information via pit ID
- Integration with the Home again scanner (Bluetooth)
- Ability to work on both ios and android devices
- Ability for app to function offline
- Easy to use interface

## Technical requirements:

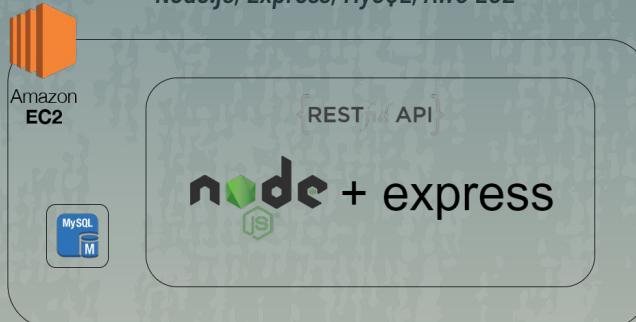

- Build using React Native, Node.js, Express, Bluetooth classic
- Utilizes a MYSQL database for storing project data
- Designed for scalability and performance

# Implementation Overview

**Frontend**  
*React Native, JavaScript, SQLite*

**Backend**  
*Node.js, Express, MySQL, AWS EC2*

## Main Components

- Syncing
  - API calls
- New Data Entry Screen
  - New Length and River Mile for existing PIT
  - All info if newly scanned fish
- Session History Screen
- Total Catch History Screen
- View Screen
  - View all catches for that fish

# Prototype Review

## Sample Scenario :

1. Anglers opens app for first time
  - a. Database cached for offline use
  - b. View help screen for instructions on use
2. Enter PIT Tag for caught fish
  - a. View previous catch data for that fish
  - b. Enter new length/rivermile for existing PIT
  - c. If new PIT also need species
3. View Session Catch History
  - a. Sync on homepage to send your new catches and get data from other angler's catches
  - b. Session History cleared
4. View Total Catch History

# Admin Portal

### Admin Portal

Currently Viewing Catch 9

Species: RBT  
Length: 178  
Pit: 3DD.003BA02CB6  
Hex: 9891000352950  
Last Caught: 2013-01-10 00:00:00  
River Mile: -4.06

Save

The background features a landscape illustration with a bison, deer, birds, and a fisherman.

# Challenges and Resolutions

Cloud computing: Fetching data from a database in real time.

Cross platform: Utilizing modules that work for both android gradle and ios

Offline Caching: storing a local database on the users phone

Bluetooth: pairing

Duplicate data: utilizing time stamps to distinguish between different fish updates

# Software Testing Plan

Unit  
Testing

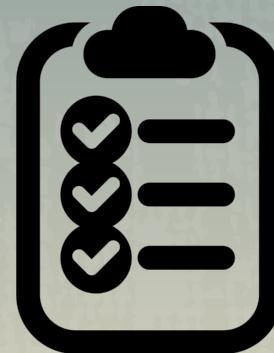

Integration  
Testing

Usability  
Testing

# Unit Testing

- Goal: Verify that all modules work as intended, look for errors
- Our Use Cases:
  - Data Entry and Upload
  - Connecting via Bluetooth
  - Offline Syncing
  - Navigating Between Screens
- Testing by attempting to break the application

# Integration Testing

- Goal: Ensure that all modules work together as intended
- Bottom-Up Approach
  - Focus on testing lower-level components first, working upwards towards higher-level components
- Ex: Testing the upload function first, then the download function, and finally the sync module which utilizes both

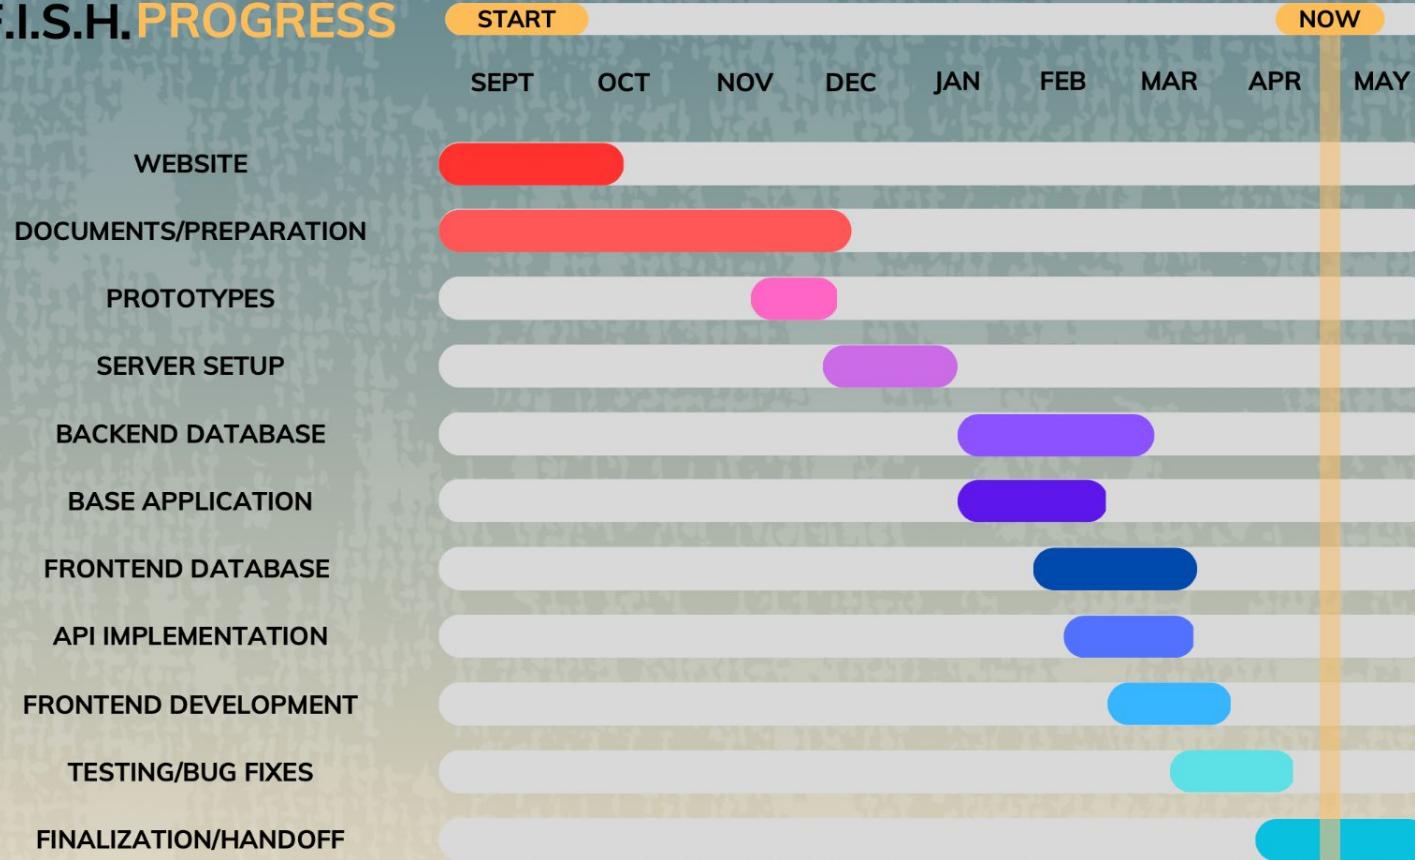

# Usability Testing

- Goal: Make sure the app is intuitive
- Talking to anglers
  - Anglers are our key demographic
- Testing for intuitiveness is important
  - Users should be able to use all functions in the app with little-to-no guidance
- App should be simple and straightforward

# F.I.S.H.PROGRESS

# Future Work

- Expansion to other wildlife tracking organizations
- Expansion to Game and Fish Departments in other states
- Increasing the size of the main database
- Implementation of Bluetooth capabilities with IOS devices
- Data upload portal for web interfaces for users (not AZGFD researchers)
- Gamification to incentivize data entry

# Conclusion

- AZGFD needs more data on the fish they are monitoring, our app will fix that
- Will help remove limitations
- Anglers will get to see information too, all while offline
- Met clients requirements
- Will revolutionize the angler data collection program
- NEXT UP: Documentation, giving to client
- Prototype was very well-received

P

# Thank you!

Any  
questions?
